Govt. Stanley Hospital's vascular surgeons perform complex surgeries on two patients under CMCHIS

CHENNAI – 26 Nov, 2026 Vascular surgeons at the Government Stanley Medical College Hospital (SMCH) performed two high-risk, complex surgeries on a 60-year-old man from Coimbatore, who had an aneurysm of the aortic arch, and a 19-year-old woman from Villupuram, who had an aneurysm of the superior mesenteric artery, a major blood vessel supplying blood to the intestines.

K. Elancheralathan, professor and head, Department of Vascular Surgery, SMCH said that the man was diagnosed with a saccular aneurysm in the arch of the aorta, the major blood vessel that carries blood from the heart to the rest of the body. The aneurysm was located at a critical anatomical site, from which blood vessels supplying to both sides of the brain and the upper limbs arise. An aneurysm is an abnormal bulge in the wall of a blood vessel and can be life-threatening if it ruptures, he told reporters on Wednesday.

"The patient had back pain and had also undergone radiation treatment for oral cancer (leading to hostile plastered neck and it was avoided for bypass procedure). He had consulted various private hospitals in Coimbatore and finally came to SMCH.
